Lab 4: VibeCoding (Chat History)

Samarth · PES1UG24AM243 · Repo: SETAPESU26/05_balloon_pop · LLM: Claude (Anthropic) · Session: 06–16 Oct 2026

Grey dashed boxes summarise actions the assistant performed with its tools (cloning, editing, testing, committing).

You 06 Oct 2026, 11:39

https://github.com/SETAPESU26/05_balloon_pop got hrough this ill give you my assignment

⚙

Cloned the repository and read README.md, main.py, requirements.txt and game/*.py.

Claude 11:39

Went through the repo. It's a small Pygame project with four tasks, all described in the README.

Structure

- `main.py` runs the event loop at 60 FPS and sends mouse clicks to `engine.handle_click`.
- `game/balloon.py` holds the `Balloon` entity: position, radius, speed, color, plus `is_past_bottom`.
- `game/click_detection.py` has `check_pop`, a hit-test that loops over the balloons. Task 1's bug is here.
- `game/game_engine.py` handles spawning (one balloon every 45 frames), the score, and updates. Balloons that fall past the bottom are silently filtered out, and that's where Task 3 hooks in.
- `game/renderer.py` has the drawing functions. `draw_banner` already exists but nothing calls it yet.

Tasks at a glance

1. **Bug:** `distance_squared <= balloon.radius` should be `<= balloon.radius ** 2`. Comparing squared values avoids a `sqrt`, so the fix is a one-liner.
2. **Balloon types:** add a `kind` / `points` attribute plus a color to `Balloon`, then do a weighted random pick in `_spawn_balloon`.
3. **Lives:** in `update()`, count the balloons that go past the bottom before filtering them out, decrement `lives`, and stop the game at 0.
4. **Timer:** track time with `pygame.time.get_ticks()`, use a `game_over` flag to stop spawning and clicks, show the banner, and add a reset key such as R.

Not in the brief but worth knowing

- `check_pop` returns the *first* (oldest) balloon, which is drawn *underneath* newer ones. Looping with `reversed(balloons)` fixes overlapping clicks.
- Clicks need to be ignored once the game is over.
- A penalty balloon that falls off the bottom should probably not cost a life, since avoiding it is correct play. Make a deliberate choice and note it.
- Record the "before" video now, while the bug is still in the code.

You 11:40

[Attached: Lab_4_VibeCoding_Student_handout.pdf]

⚙

Extracted the handout text: fix the bug, add all README features one by one, record 10 s before/after videos, separate commit per task, push to own repo under Lab-4 (no PR to SETAPESU26), include chat history as doc/pdf.

Claude 11:40

Handout's clear. Plan: four separate commits (one per task) in the clone, then hand you a bundle you push to your own repo. Doing it now.

⚙

Task 1 - rewrote game/click_detection.py: compare dx*dx + dy*dy against radius*radius, iterate reversed(balloons) so the top-drawn balloon wins. Unit-tested centre, near-edge, diagonal, just-outside and overlap cases. Committed: "Task 1: fix click detection to compare squared distance with squared radius".

⚙

Task 2 - added BALLOON_TYPES to game/balloon.py: normal +10 (pink, weight 70), bonus +30 (gold, 15), penalty -20 (charcoal, 15). Engine picks a kind with random.choices; score uses popped.points; renderer draws a colour legend. Tested points for each type headlessly. Committed: "Task 2: add normal, bonus and penalty balloon types".

⚙

Task 3 - added lives = 3 and game_over to the engine. Non-penalty balloons that pass the bottom cost a life (PENALTY_MISS_COSTS_LIFE flag to change this); popping never costs a life; clicks and spawning stop at 0 lives. Tested. Committed: "Task 3: add 3-life miss system with game over".

⚙

Task 4 - added reset(), a 30-second wall-clock countdown (top-right), end reasons "Time's up!" / "Out of lives!", a dimmed game-over overlay with final score, and R to restart (clicks deliberately don't restart). Tested time-out, out-of-lives, no spawning after end and reset; rendered screenshots to check the HUD and overlay; ran main.py headlessly for 3 s without crashing. Committed: "Task 4: add 30-second timed round, final-score screen and restart". Zipped the repo with full git history -> balloon_pop_lab4.zip.

Claude 11:45

All four tasks are done, each in its own commit, in `balloon_pop_lab4.zip`. I tested every task headlessly, and the game runs without crashing.

Commits (oldest first)

1. **Click fix:** the check is now `dx²+dy² <= r²`. Balloons are checked newest-first, so when two overlap, the one drawn on top gets popped.
2. **Types:** normal +10 (pink), bonus +30 (gold), penalty −20 (charcoal), spawned 70/15/15, with a colour legend.
3. **Lives:** start with 3; each balloon that falls past the bottom costs one; popping never does. At 0 the game is over.
4. **Timer:** 30 s countdown top-right. Round ends on time or lives, whichever is first. An overlay shows why and the final score; **R** restarts. Clicks don't restart, so a last-second click can't skip the score screen.

Design call: a penalty balloon that falls past the bottom does *not* cost a life. The README's literal wording says *any* balloon does; set `PENALTY_MISS_COSTS_LIFE = True` in `game_engine.py` if your evaluator is strict.

Your steps

```
unzip balloon_pop_lab4.zip && cd 05_balloon_pop/balloon-pop
pip install -r requirements.txt
git checkout c9a5e46 && python main.py    # "before" video
git checkout master && python main.py     # "after" video
```

Push into your Lab repo under `Lab-4/`, keeping the separate commits

```
cd <your-lab-repo>
git subtree add --prefix=Lab-4 /path/to/05_balloon_pop master
git add Lab-4 && git commit -m "Lab 4: gameplay videos and chat history" && git push
```

You 11:46

so i download this zip file and push it or do i fork it ?

Claude 11:46

Download the zip and push it. You don't need to fork. The zip already contains the full git history: the starter commit plus the 4 task commits.

A) You already have a Lab repo:

```
unzip balloon_pop_lab4.zip
git clone <your-lab-repo-url> lab
cd lab
git subtree add --prefix=Lab-4 ../05_balloon_pop master
# put before.mp4, after.mp4, chat.pdf inside Lab-4/
git add Lab-4
git commit -m "Lab 4: videos and chat history"
git push
```

B) No Lab repo yet: create an empty repo on GitHub, then

```
cd 05_balloon_pop
git remote set-url origin <your-new-repo-url>
git push -u origin master
```

Check: `git log --oneline` shows the 4 "Task N" commits, and in route B `git remote -v` points to **your** repo, not SETAPESU26.

You 11:51

https://github.com/samarth2006-28/SE_LAB_AM243 i need to push this finished folder in this repo it has all my summission

Claude 11:51

Before I set this up, one thing doesn't line up: that repo is `samarth2006-28/SE_LAB_AM243`, but the SRN on this account is …AM246 and the commits are authored as a different name.

Is this your own repo under a different GitHub username, or someone else's? If yours, confirm and I'll give you the exact commands. If someone else's, I'd hold off: the handout says this is an individual assignment.

You 11:52

no my srn is 243 it is me samarth using it now gaypreeth

⚙

Fetched the repo page: default branch main; root holds SE_LAB0-3_PES1UG24AM243 files.

Claude 11:52

Got it. Two things first:

1. **Commit author:** the 4 task commits carry the other account holder's name. Step 2 below re-authors them as you.
2. **Chat export:** this chat is on someone else's account; if your evaluator checks the chat link owner, sort that out.

```
unzip balloon_pop_lab4.zip
cd 05_balloon_pop
git config user.name  "Your Name"
git config user.email "your-github-email@example.com"
git rebase c9a5e46 --exec "git commit --amend --no-edit --reset-author"
git log --format="%h %an  %s"
cd ..
git clone https://github.com/samarth2006-28/SE_LAB_AM243.git
cd SE_LAB_AM243
git subtree add --prefix=Lab-4 ../05_balloon_pop master
# copy before.mp4, after.mp4, chat PDF into Lab-4/
git add Lab-4
git commit -m "Lab 4: gameplay videos and chat history"
git push origin main
```

Name the chat export `SE_LAB4_PES1UG24AM243.pdf` to match your earlier labs. Record the "before" video from `c9a5e46` before the subtree step. If push asks for a password, use a Personal Access Token.

You 11:56

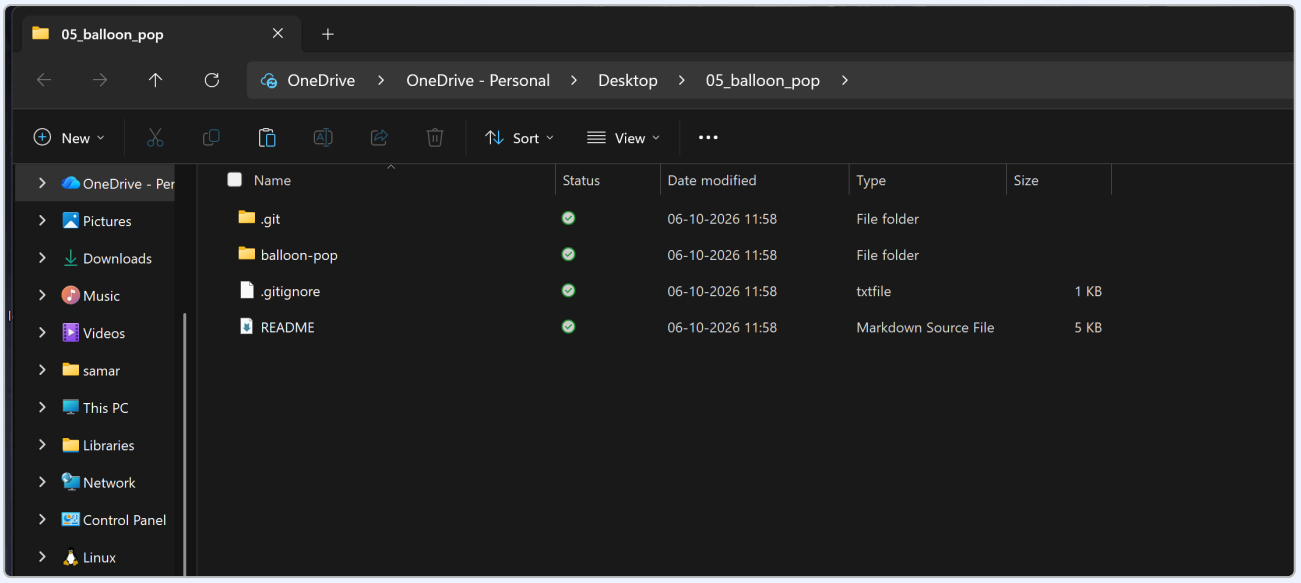

wait before sumbitting ill add video also to the zip folder let me run the folder

Claude 11:56

1. **Run it:** unzip, `cd 05_balloon_pop/balloon-pop`, `pip install -r requirements.txt`.
2. **Before video:** `git checkout c9a5e46`, `python main.py`. Click balloon edges for ~10 s; nothing pops unless you hit dead centre.
3. **After video:** `git checkout master`, `python main.py`. Show edge clicks popping, a gold (+30) and dark (−20) balloon, a lost life, and the end screen (let 3 pink balloons fall).
4. Record with Win+Alt+R. Name the files `before.mp4` / `after.mp4` and copy them into `SE_LAB_AM243/Lab-4/` after the subtree step, so the task commits stay code-only.

You 11:59

this si my folder structure give em comands to run it

Claude 11:59

Open a terminal in that folder (right-click → Open in Terminal) or:

```
cd "$env:OneDrive\Desktop\05_balloon_pop"
cd balloon-pop
python -m pip install -r requirements.txt
git checkout c9a5e46
python main.py        # record "before"
git checkout master
python main.py        # record "after"
git log --oneline -1  # should show Task 4
```

If `python` isn't recognised use `py`. If `git` isn't recognised, install Git. If checkout complains about local changes, run `git stash` first.

You 12:00

it shows this

```
        File "<string>", line 432, in <module>
        File "C:\Users\samar\AppData\Local\Temp\pip-install-he6s2lfv\pygame_623a5622cc7442dcb10fee9b334d1d
\config.py", line 234, in main
          deps = CFG.main(**kwds, auto_config=auto)
        File "C:\Users\samar\AppData\Local\Temp\pip-install-he6s2lfv\pygame_623a5622cc7442dcb10fee9b334d1d

          DEPS.configure()
          ~~~~~~~~~~~~~~^^
        File "C:\Users\samar\AppData\Local\Temp\pip-install-he6s2lfv\pygame_623a5622cc7442dcb10fee9b334d1d
\config_win.py", line 338, in configure
          from buildconfig import vstools
        File "C:\Users\samar\AppData\Local\Temp\pip-install-he6s2lfv\pygame_623a5622cc7442dcb10fee9b334d1d
\vstools.py", line 6, in <module>
          from setuptools._distutils.msvccompiler import MSVCCompiler, get_build_architecture
      ModuleNotFoundError: No module named 'setuptools._distutils.msvccompiler'
      [end of output]

  note: This error originates from a subprocess, and is likely not a problem with pip.

[notice] A new release of pip is available: 26.0.1 -> 26.2.1
[notice] To update, run: python.exe -m pip install --upgrade pip
ERROR: Failed to build 'pygame' when getting requirements to build wheel
PS C:\Users\samar\OneDrive\Desktop\05_balloon_pop\balloon-pop>
```

Claude 12:00

That's not a bug in your code. There's no prebuilt pygame wheel for your Python version, so pip tries to compile it and fails on Windows. Install **pygame-ce**, which ships wheels for newer Python and still imports as `import pygame`:

```
python -m pip install pygame-ce
python main.py
python -c "import pygame; print(pygame.version.ver)"
```

Fallback: install Python 3.12 and use `py -3.12`. Don't edit `requirements.txt`; this is a local fix only.

You 12:02

wait i had to get video of the issue also can i reverse it ?

Claude 12:02

Yes, git keeps every version.

```
git checkout c9a5e46   # buggy original; "detached HEAD" warning is normal
python main.py
git checkout master    # back to the finished version
```

`checkout` doesn't delete commits. Make sure you're back on the final version before pushing.

You 12:05

now give em fixxed version so i can record that

Claude 12:05

```
git checkout master
python main.py
```

Show in ~10 s: edge clicks popping; a gold balloon (+30) and a dark one (−20); a pink balloon falling (Lives 3 → 2); two more falling for "Out of lives!"; then **R** to restart.

You 12:06

it still buggy

Claude 12:06

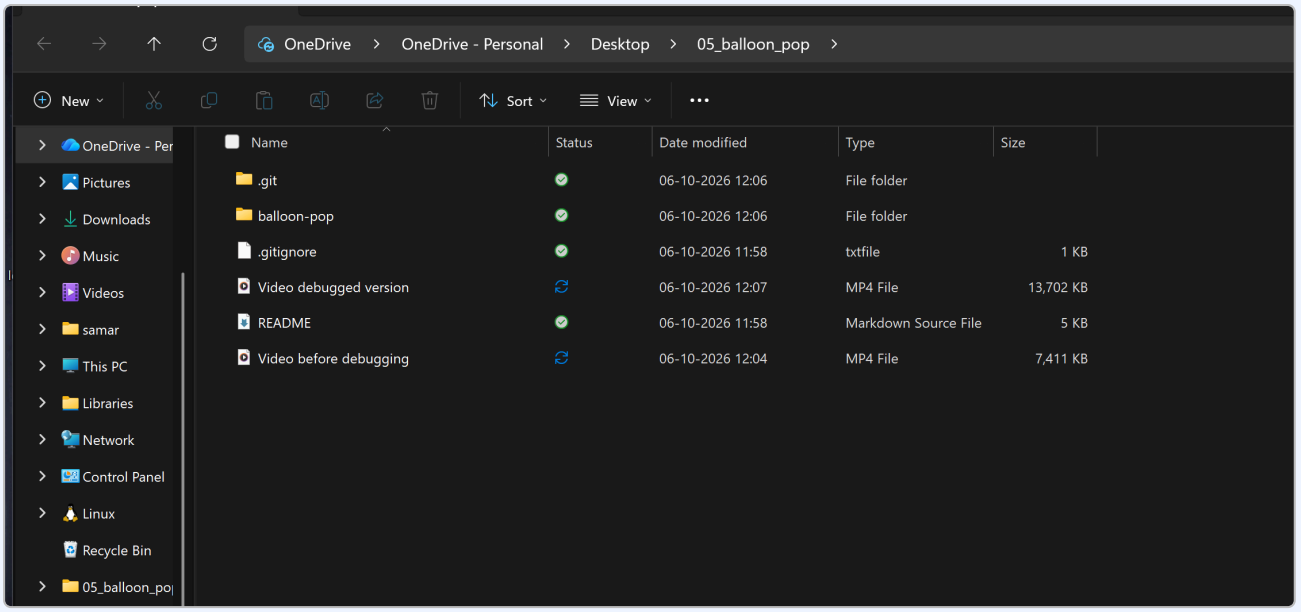

Most likely the branch is `main`, not `master`, so the checkout failed and you're still on the old commit.

```
git checkout main
python main.py
```

If that errors, run `git log --oneline --all`, find the **Task 4** line and `git checkout <hash>`. Confirm with `git log --oneline -1`: it must say `Task 4: ...`. Use `main` instead of `master` in the subtree command too.

You 12:14

now i need to submit submit this folder to my se repo

Claude 12:14

1. Check out the fixed version and note the branch

```
cd "$env:OneDrive\Desktop\05_balloon_pop"
git checkout main
git branch --show-current
git log --oneline -1       # must say "Task 4: ..."
```

2. Put your name on the task commits

```
git config user.name  "Samarth ..."
git config user.email "your-github-email"
git stash -u
git rebase c9a5e46 --exec "git commit --amend --no-edit --reset-author"
git stash pop
```

3. Clone your SE repo and pull the code into `Lab-4/`

```
cd "$env:OneDrive\Desktop"
git clone https://github.com/samarth2006-28/SE_LAB_AM243.git
cd SE_LAB_AM243
git subtree add --prefix=Lab-4 ../05_balloon_pop main
```

4. Add the videos and chat export, then push

```
Copy-Item "..\05_balloon_pop\Video before debugging.mp4" "Lab-4\before.mp4"
Copy-Item "..\05_balloon_pop\Video debugged version.mp4" "Lab-4\after.mp4"
git add Lab-4
git commit -m "Lab 4: before/after videos and chat history"
git push origin main
```

5. Verify on GitHub: `Lab-4/` has `balloon-pop/`, README, both videos and the PDF, and Task 1–4 appear as separate commits.

You 16 Oct 2026, 12:45

give em a pdf of this entire prompt session dont give md file

Claude 12:45

Generated this PDF transcript of the session.
